LinkUp App Description

LinkUp is an iOS application that allows job candidates to upload their information to be viewed by recruiters, who can swipe left or right on these candidates' profiles to either reject or connect with them. We used React Native and AWS Amplify for our front-end and back-end models, respectively.

Project Requirements

Display Dynamic Data

Candidate profiles are updated and shown dynamically to recruiters as they add their information to the database. Companies are dynamically displayed to candidates when recruiters swipe right.

Upload Data to Backend

Both candidates and recruiters upload their information to create their profiles, storing this information in the database.

Search through Server-Side Data

Candidates can filter the list of companies to only display companies that swiped right. +

3 Distinct Features

Swiping Left/Right

Recruiters swipe left and right on candidates to reject or connect with them, respectively.

Role Selection at Login

The login screen allows the app user to choose between the candidate and recruiter roles.

Notifications

Potential job opportunities page shows candidate which companies that have swiped right on them.
